

Acute Ischemic Stroke: Time vs Tissue

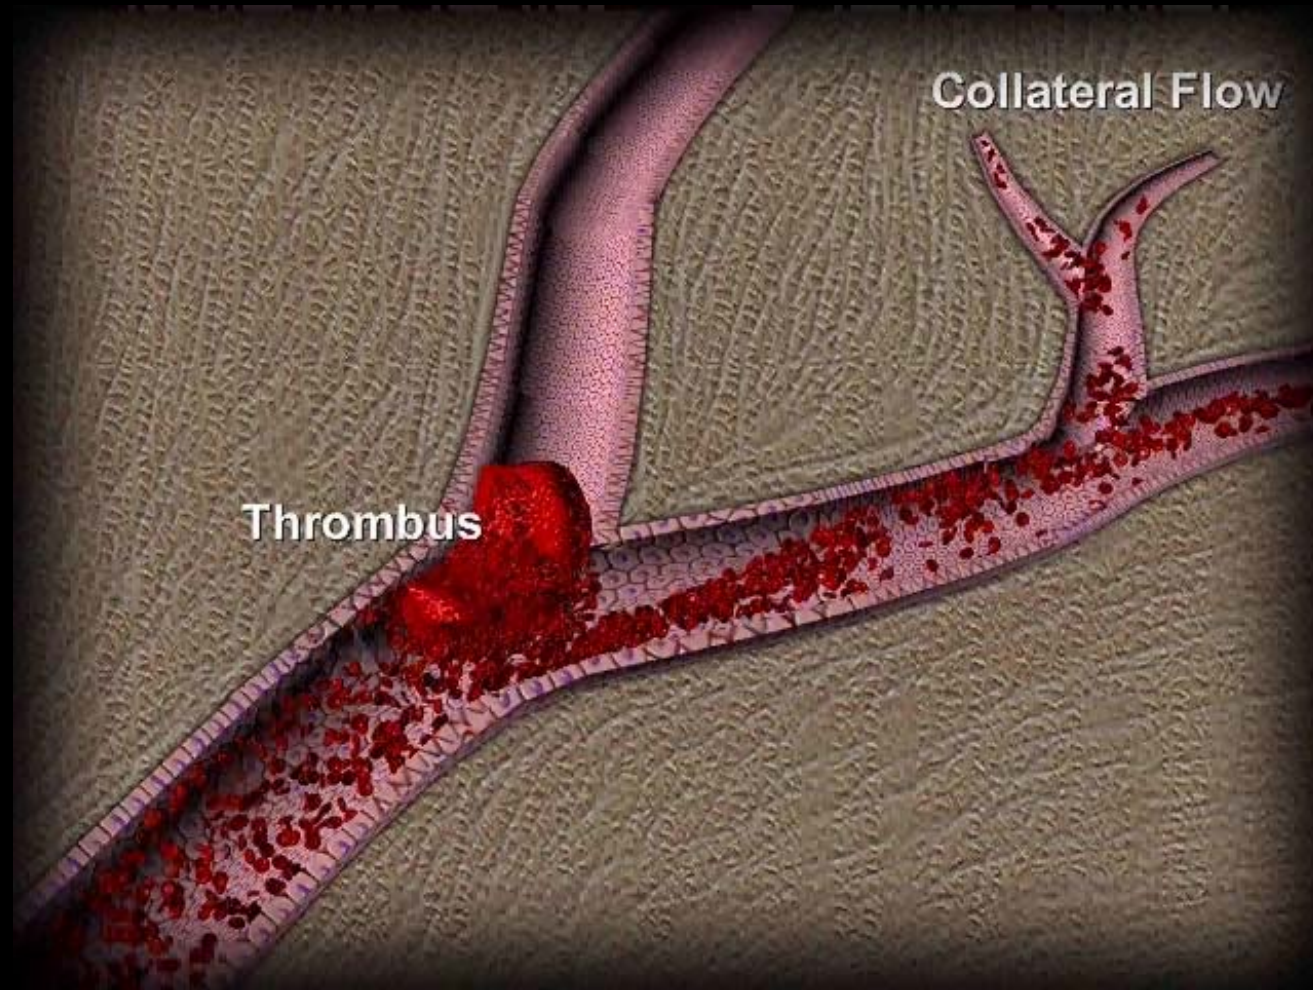

Greg Albers, MD

Coyote Foundation Professor of Neurology and Neurological Sciences
Stanford University School of Medicine
Director, Stanford Stroke Center
Stanford University Medical Center

Stroke Treatment in 2010

- Problem: very few stroke patients receive treatment (5%)
- Two treatments FDA approved:
 - Intravenous tPA – treatment must begin <3-4.5 hrs
 - Mechanical devices; FDA approval but not clear who benefits and effective time window

Advances in Stroke Imaging:

The Mismatch Concept

- Infarct Core (game over):
Diffusion Weighted MRI (DWI)
- Penumbra or salvageable:
Perfusion Weighted MRI (PWI)
- Mismatch ratio:
Penumbra/Core

The Mismatch Concept

DEFUSE Study

***D**WI / **P**WI

DEFUSE 2 Protocol

MRI
baseline

Intra-arterial
Therapy

MRI
Post-procedure
(reperfusion)

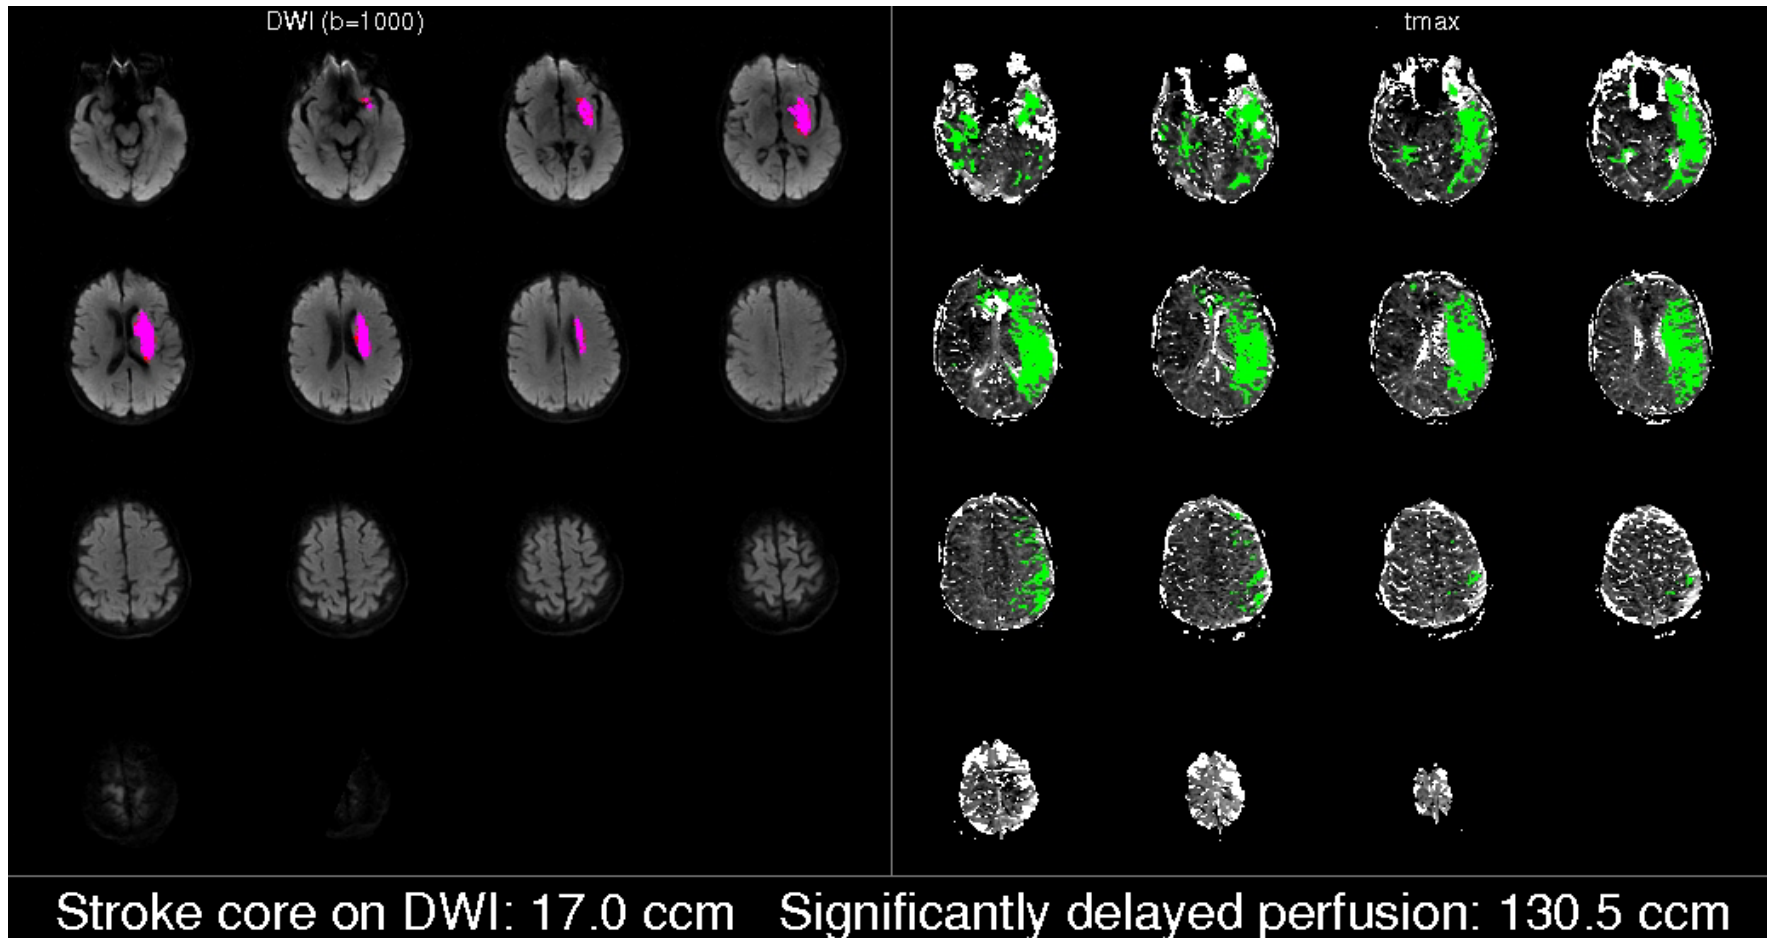

MRI
Day 5
(infarct volume)

Favorable clinical response:

- NIHSS score of 0-1 at day 30 or improvement of NIHSS score by ≥ 8 points between baseline and day 30

88-Year-Old Female - IV t-PA Not Effective

After Mechanical Clot Removal

Complete neurologic recovery at 24 hrs

Use of Imaging to Monitor Stroke Therapies

79 yo female, left side paralysis

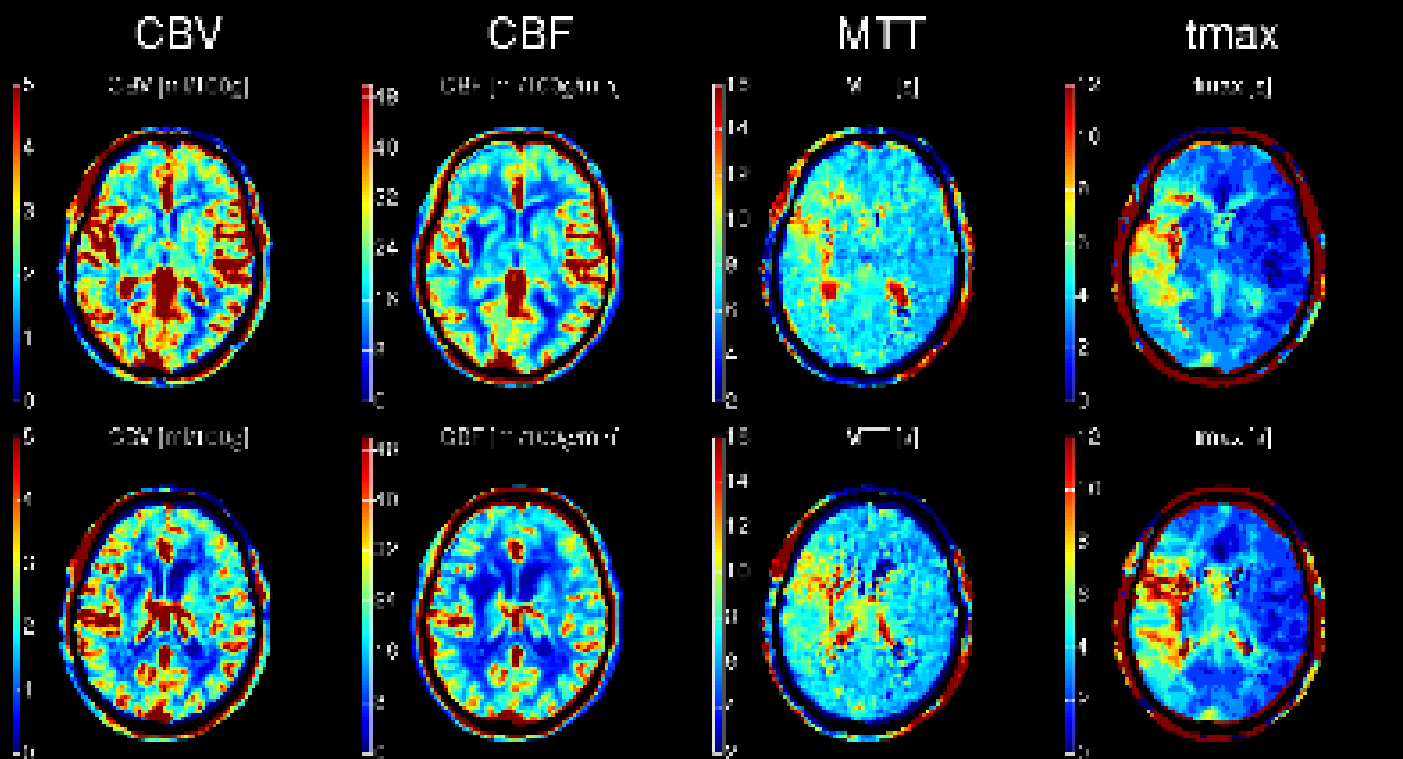

image for research purposes only

CT Perfusion at 6.5 hours

Blocked Artery Open at 8 Hours

No blood flow to parts of brain

Restored blood flow

Blocked Artery Open at 8 Hours

Angiogram pre and post mechanical device

No blood flow to parts of brain

Restored blood flow

DWI at 16 hours

DWI at 16 hours

Tmax at 16 hours

DWI at 16 hours

DWI at 3 days

88-Year-Old Female - IV t-PA Not Effective

Stroke core on DWI: 17.0 ccm Significantly delayed perfusion: 130.5 ccm

61-Yr-Old, 7 hrs After Left Side Paralysis

PWI lesion for $t_{max} > 6.0s$: 152.7 ccm
DWI lesion (total): 40.6 ccm, mismatch ratio: 3.8

Recanalization at 6 hours after onset

Baseline PWI lesion=153 cc

Early follow-up PWI lesion=45 cc

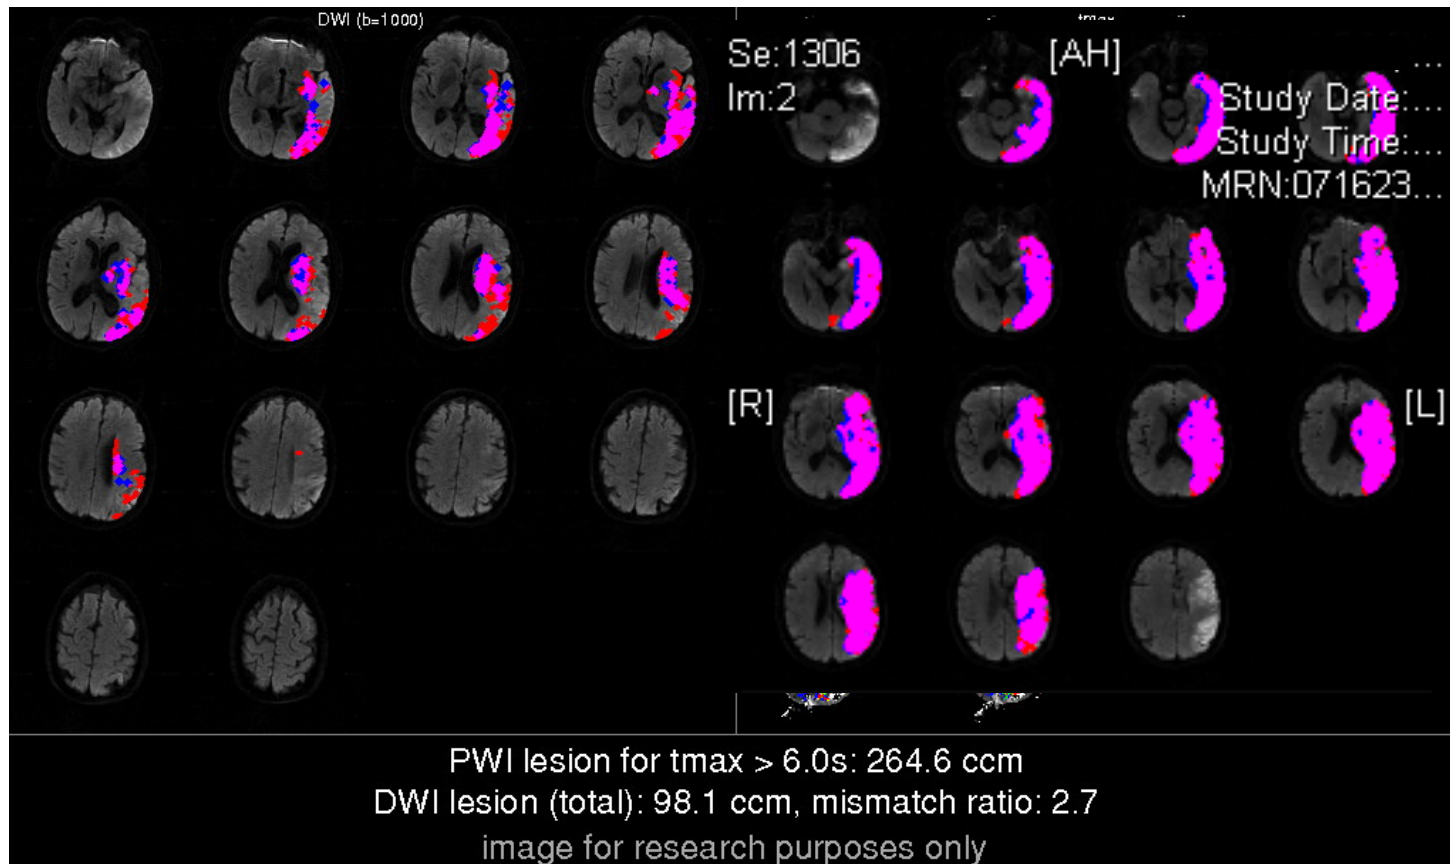

Final stroke size= 45 cc

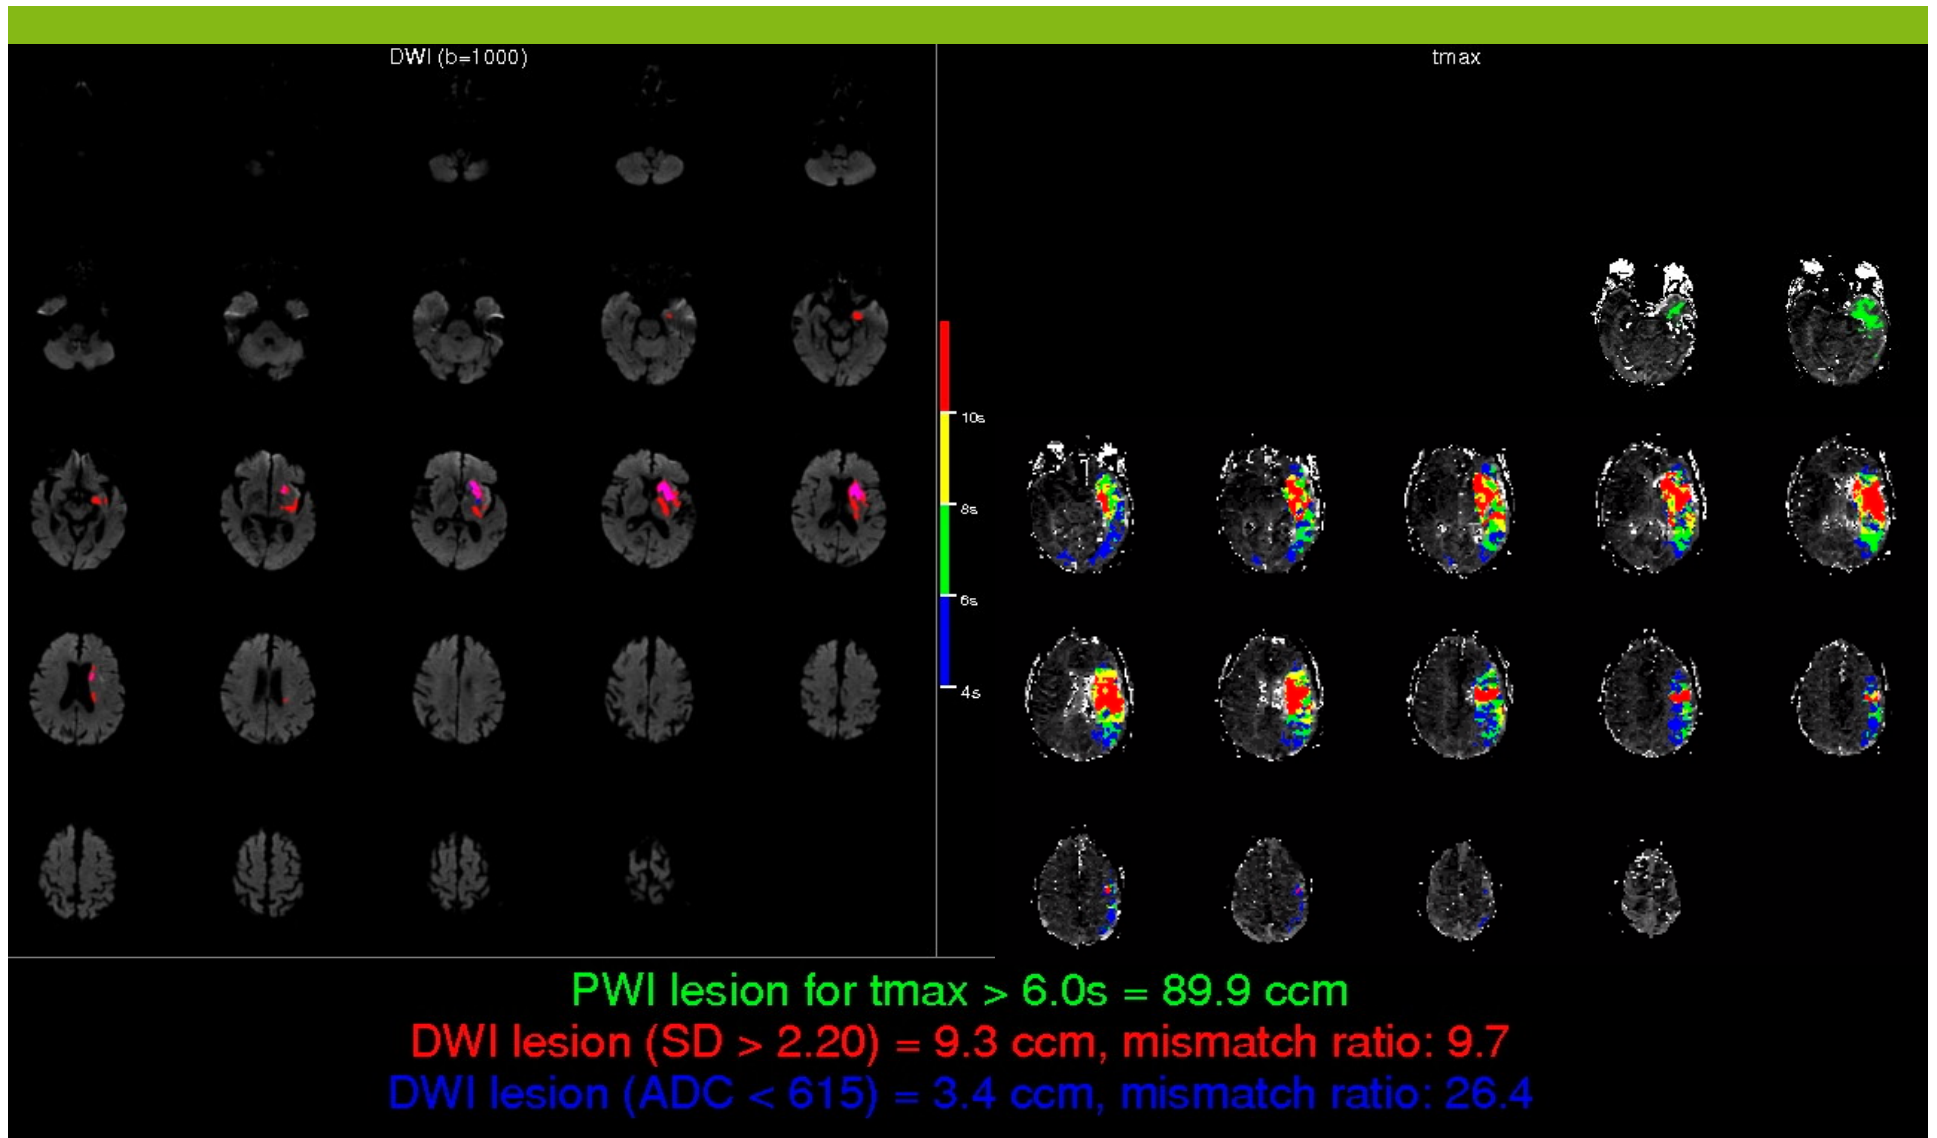

Tissue vs. Time

62 yo male 2.5 hrs after symptom onset- CT PERFUSION

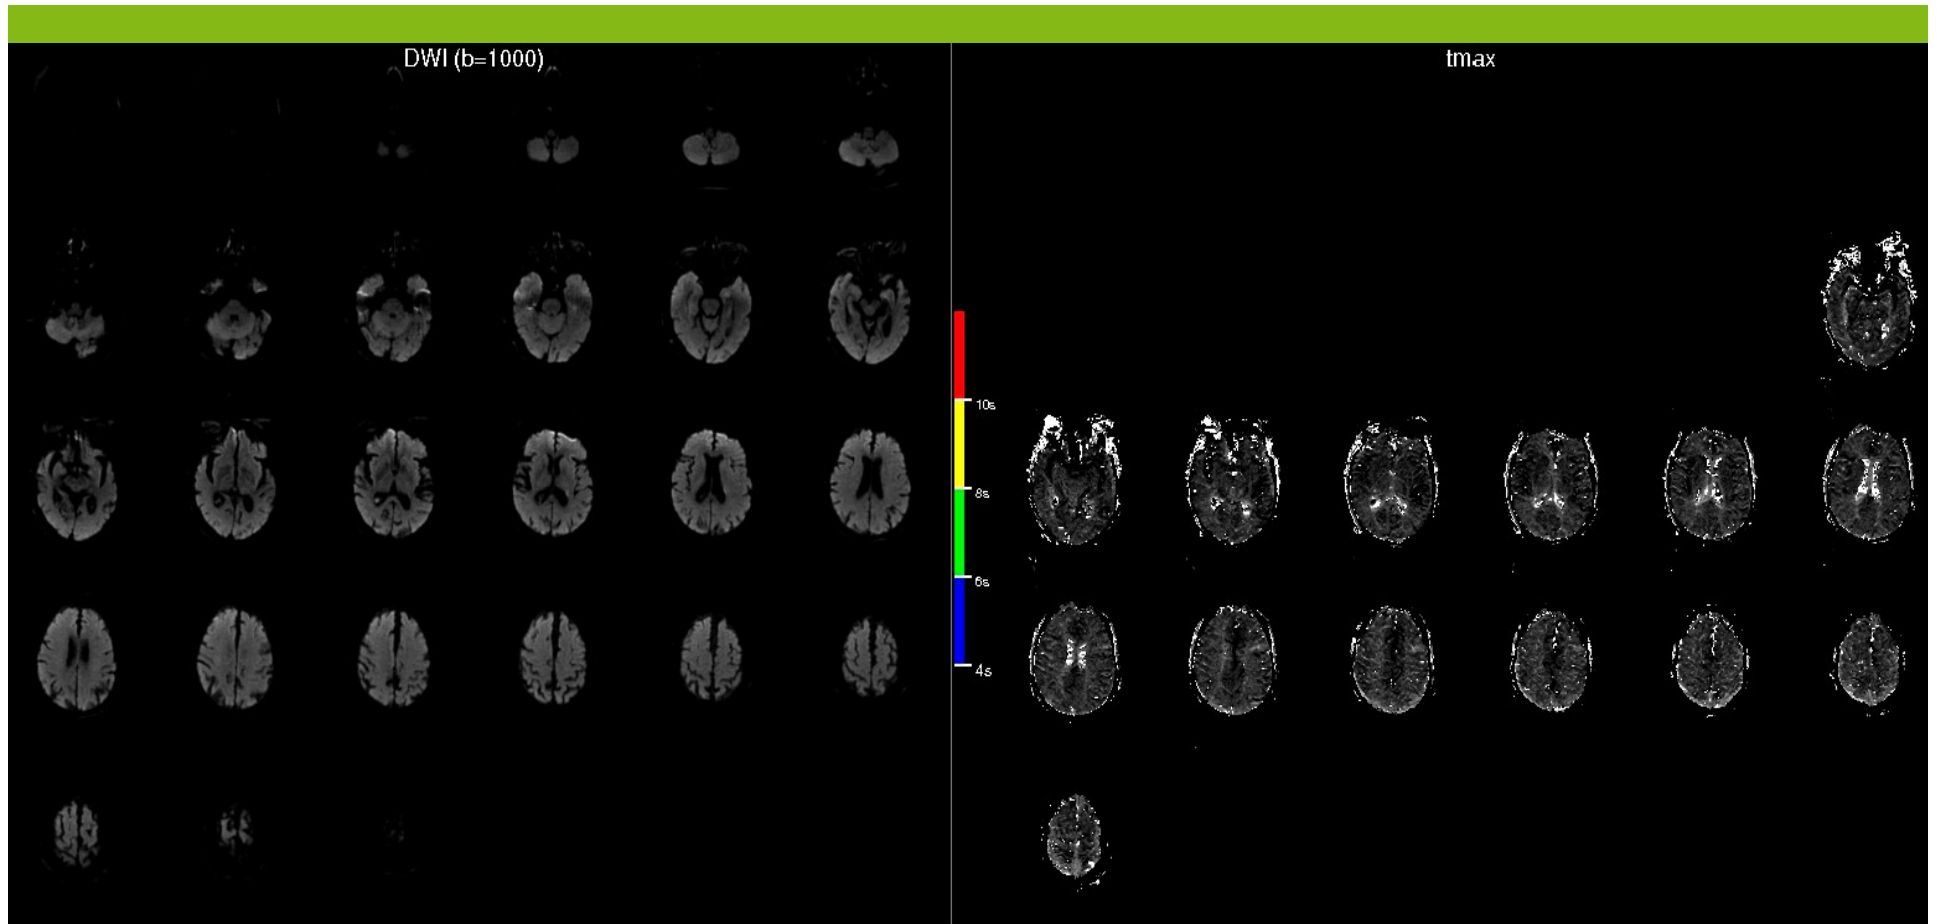

82 yo female, iv tpa not effective, severe stroke symptoms

Carotid artery open at 4 hours

Follow-up MRI 4 hours later (8 after onset). Full recovery

PWI lesion for $t_{max} > 6.0s = 0.0 \text{ ccm}$

DWI lesion ($SD > 2.20$) = 0.0 ccm, mismatch ratio: none

DWI lesion ($ADC < 615$) = 0.0 ccm, mismatch ratio: none

Baseline DWI lesion= 10 cc; NIH 22

Baseline PWI lesion

Day 3: Flair lesion = 11 cc; NIH 0

How to Increase the Effectiveness of Stroke Treatment:

- Use advanced imaging to triage and monitor therapy
- Don't treat patients with severe irreversible damage
- Treat patients with salvageable tissue even if they arrive late
- Use intravenous tPA for small clots; mechanical devices for large clots
