San Mateo County Emergency Medical Services

Childbirth (Mother)

For delivery or imminent delivery of a fetus beyond the first trimester (12 weeks). For < 12 weeks use Pregnancy Complication

History
• Due date
• Time contractions started/how often
• Rupture of membranes
• Time/amount of any vaginal bleeding
• Sensation of fetal activity
• Past medical and delivery history
• Medications
• Gravida/Para status
• High risk pregnancy

Signs and Symptoms
• Contractions
• Vaginal discharge or bleeding
• Crowning or urge to push
• Meconium

Differential
• Abnormal presentation
  • Buttock
  • Foot
  • Hand
• Prolapsed cord
• Placenta previa
• Abruptio placenta

When supine, place patient in left lateral recumbent position

Note any abnormal vaginal bleeding, hypertension or hypotension

Inspect perineum

Crowning > 36 weeks gestation

Monitor and reassess
Document frequency and duration of contractions

Childbirth procedure

Unable to deliver?
Create air passage by supporting presenting part of the infant

Prolapsed cord or shoulder dystocia

Hips elevated Knees to chest
Insert fingers into vagina to relieve pressure on cord
Place saline dressing over cord

Breech birth

Transport unless delivery imminent
Encourage mother to refrain from pushing
Support presenting part(s) DO NOT PULL

Notify receiving facility. Consider Base Hospital for medical direction

Priority symptoms:
• Crowning at < 36 weeks gestation
• Abnormal presentation
• Severe vaginal bleeding
• Multiple gestation

Pregnancy Complication
Pearls

• Do not perform digital vaginal exam
• Document all times (delivery, contraction frequency and length, and time cord was cut).
• Document the name of the prehospital provider who cut the cord.
• After delivery, massaging the uterus (lower abdomen) will promote uterine contraction and help to control post-partum bleeding.
• Some perineal bleeding is normal with any childbirth. Large quantities of blood or free bleeding are abnormal.
• For prolapsed cord, wrap cord in saline soaked gauze cover to keep warm.
