

Narrow Complex Tachycardia

History

- Medications (e.g., Aminophylline, Adderall, diet pills, thyroid supplements, decongestants, and Digoxin)
- Diet
- Drugs (e.g., nicotine and illegal drugs)
- Past medical history
- History of palpitations/heart racing
- Syncope/near syncope

Signs and Symptoms

- Heart rate > 150 with narrow, regular complexes
- Systolic BP < 90
- Dizziness, chest pain, shortness of breath, altered mental status, or diaphoresis
- Acute Pulmonary Edema
- Potential presenting rhythm:
 - Atrial/sinus tachycardia
 - Atrial fibrillation/flutter
 - Multifocal atrial tachycardia
 - Ventricular tachycardia

Differential

- Heart disease (e.g., WPW or valvular)
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion, pain, or emotional stress
- Fever
- Hypoxia
- Hypovolemia or anemia
- Drug effect/overdose (see **History**)
- Hypothyroidism
- Pulmonary embolus

Narrow Complex Tachycardia

Pearls

- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE.
- If at any point the patient becomes unstable, move to the unstable arm of the algorithm.
- For ASYMPTOMATIC patients (or those with only minimal symptoms, such as palpitations) and any tachycardia with a rate of approximately 100 – 120 with a normal blood pressure, consider CLOSE OBSERVATION or fluid bolus rather than immediate treatment with an anti-arrhythmic medication. For example, a patient's "usual" atrial fibrillation may not require emergent treatment.
- Continuous paper recording peri-adenosine administration
- All Adenosine administrations should be immediately followed by a 20ml rapid flush.
- Unstable Signs/Symptoms include: Hypotension; acutely altered mental status; signs of shock/poor perfusion; chest pain with evidence of ischemia (e.g., STEMI, T-wave inversions or depressions); and acute pulmonary edema.
- Search for underlying cause of tachycardia such as fever, sepsis, dyspnea, etc.
- If patient has a history of Wolfe Parkinson White (WPW), Adenosine is contraindicated.
- Synchronized Cardioversion is recommended to treat UNSTABLE atrial fibrillation/flutter and monomorphic-regular tachycardia (SVT).
- Monitor for respiratory depression and hypotension associated with Midazolam.
- Activate and upload all monitor data.
