CLINICAL PEARL
• Nasal ACE2 Levels and COVID-19 in Children:
  o While a lot of attention has been rightfully given to Multi Inflammatory Syndrome or MIS-C, the syndrome remains exceedingly rare (there have only been 250 cases reported in the United States and only one in the San Francisco Bay area so far). The overwhelming majority of children have a low risk of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection and mortality, possibly because of lower rates of enzyme angiotensin-converting enzyme 2 (ACE2) nasal epithelial gene expression in children.
  o According to Bunyavanich et al, ACE2 receptor nasal epithelial gene expression is greatest in adults and lowest in young children (4 to 9 years old). While ACE2 receptor nasal epithelial gene expression is higher in older children (10 to 17 years old), it is still lower than in adults. After adjusting for sex and asthma, ACE2 expression goes up with age.

PUBLIC HEALTH UPDATE
• San Mateo County Health Officer issued a revised health officer order dated July 14th providing guidance regarding visitation in long term care facilities.
