COVID-19 Digest Issue 54

May 7, 2021

CLINICAL PEARL

- Data from the NBA’s testing program demonstrates that those who continue to test positive for SARS-CoV-2 following initial infection and diagnosis are likely no longer contagious. Published in *JAMA Internal Medicine*, these data were collected from June 11, 2020, to October 19, 2020 and cover some 4,000 NBA players, staff, and vendors who were required to undergo daily RT-PCR testing and *ad hoc* serological testing for SARS-CoV-2 antibodies. Among the 3,648 individuals who participated, 36 (1%) were persistent positive cases. Antibodies were detected in 33 individuals (91.7%) and all were asymptomatic. Cases were monitored for up to 100 days (51 days on average), during which there were at least 1,480 person-days of direct exposure activities without masks, but there were no transmission events or secondary infections of SARS-CoV-2 detected (0 new cases). These data demonstrate that following the initial infection period, even if people continue to test positive, they are likely not actively infectious.
