# Pediatric Cardiac Dysrhythmia Treatment Protocols

# Pediatric Tachycardia (Unstable)

# History

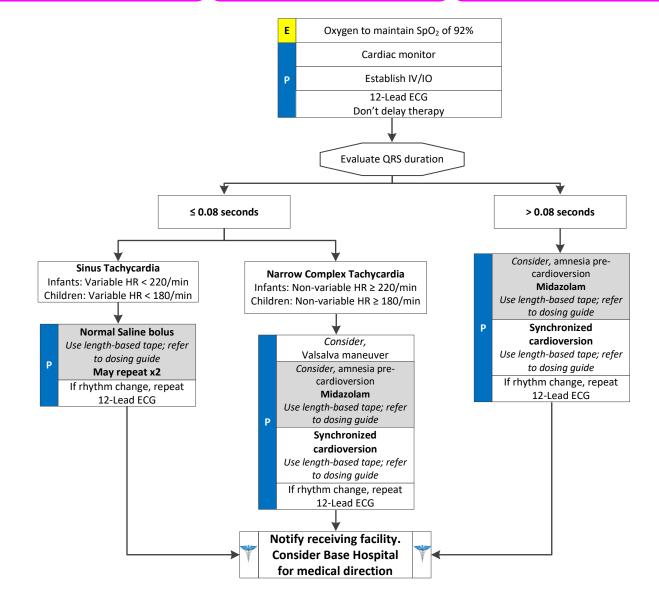

- Medications (e.g., Aminophylline, Adderall, diet pills, thyroid supplements, decongestants, and Digoxin)
- Diet (e.g., caffeine and chocolate)
- Drugs (e.g., nicotine and illegal drugs)
- · Past medical history
- History of palpations/heart racing
- Syncope/near syncope
- Renal failure
- Missed dialysis

## Signs and Symptoms

- Heart rate > 150
- Systolic BP < 90
- Dizziness, chest pain, shortness of breath, altered mental status or diaphoresis
- Acute pulmonary edema
- Potential presenting rhythm:
  - Atrial/sinus tachycardia
    - Atrial fibrillation/flutter
    - Multifocal atrial tachycardia
    - · Ventricular tachycardia

### Differential

- · Heart disease (e.g., WPW or valvular)
- Sick sinus syndrome
- Myocardial infarction
- Electrolyte imbalance
- Exertion, pain, or emotional stress
- Fever
- Hypoxia
- Hypovolemia or anemia
- Drug effect/overdose (see History)
- Hypothyroidism
- Pulmonary embolus

# Pediatric Tachycardia (Unstable)

### Pearls

- Most important goal is to differentiate the type of tachycardia and if STABLE or UNSTABLE.
- Unstable is defined by poor perfusion, hypotension, respiratory difficulty and altered mental status.
- Early transport is always appropriate in unstable patients.
- Consider presentation and known history. Search for and treat cause(s).
- Separating the child from the caregiver may worsen the child's clinical condition.
- Pediatric pads should be used in children < 10kg or length-based measurement of Purple.
- Monitor for respiratory depression and associated hypotension associated if Midazolam is used.

Treatment Protocol PD03
