Secondhand smoke (SHS)

- Smoking causes over 140,000 cardiovascular deaths in the US per year
- Secondhand smoke is estimated to cause ~50,000 US deaths/year, mostly from cardiovascular disease
- Smoking bans in public places lead to reduction in frequency of heart attacks

Secondhand smoke (SHS)

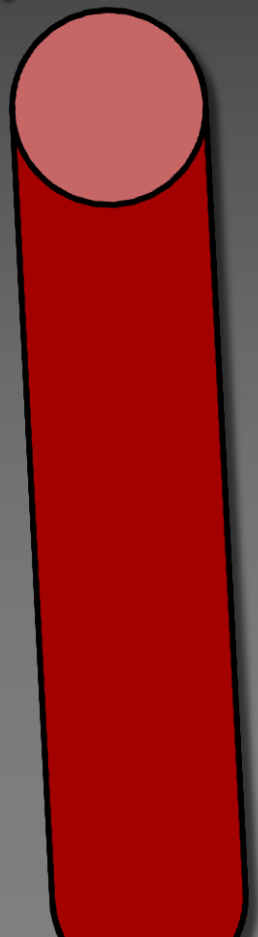
Longterm secondhand smoke exposure impairs *vascular endothelial function*

“blood vessel function”

Tobacco secondhand smoke exposure impairs ability of arteries to *vasodilate* when they need to pass more blood

(**Vasodilation**: Arteries grow in diameter when necessary)

Important: Impairment is temporary, but repeated exposures lead to long-term impairment



Measuring Endothelial Function

- Principle of Flow-Mediated Dilation (FMD) -

Ischemic dilation of downstream vessels

↓

Flow in artery ↑

↓

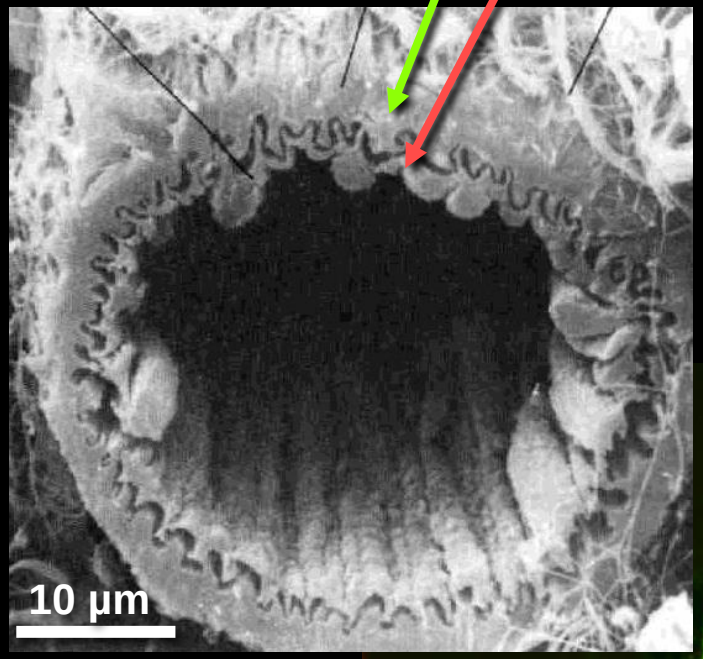
Shear stress on endothelium ↑

↓

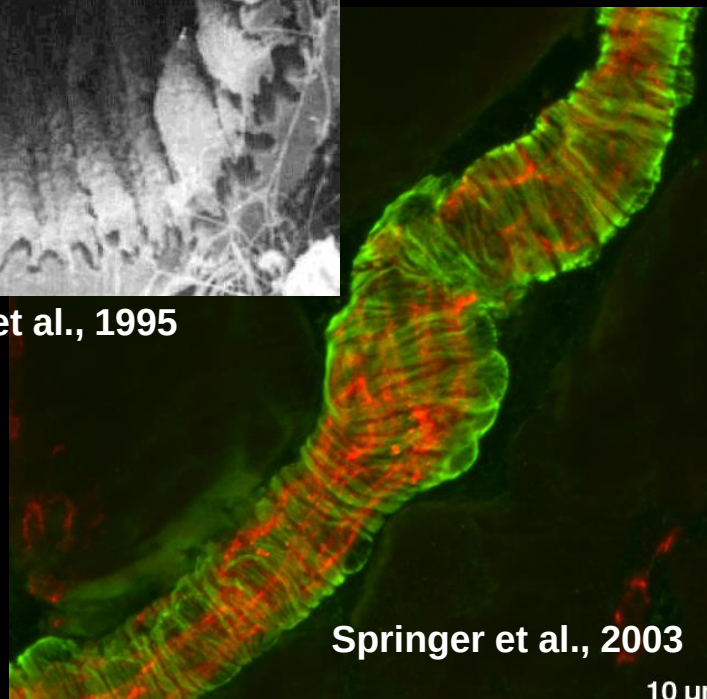
Nitric oxide ↑

↓

Flow-mediated vasodilation



Alberts et al., 1995



Springer et al., 2003

Brachial artery FMD gets lower with increasing cardiovascular risk factors

Dilation of coronary arteries in response to increased coronary blood flow gets lower with increasing cardiovascular risk factors
(Nabel, Selwyn, and Ganz, 1990)

Improves FMD:
Dark chocolate, green tea, red wine, *etc*.

Impairs FMD:
Age, smoking, secondhand smoke, *etc*.

Measuring Endothelial Function

marijuana was ammonia. In marijuana smoke, ammonia was found at levels about 20-fold those in tobacco in mainstream smoke (Table 3) and about 3-fold greater in sidestream smoke (Table 4), although the absolute values were very much greater in sidestream smoke. The amount of ammonia produced during combustion of tobacco has been related to the amount of nitrate fertilizer applied during growth (*30*). The simplest explanation for the very high levels of ammonia found in marijuana smoke may be that the marijuana used for this study contained more nitrate than the tobacco sample. The marijuana plants were grown on soil-less growth medium. All fertilizers were commercially available and consisted of water-soluble hydroponic vegetable fertilizers used for horticulture and contained nitrogen

in the form of both nitrate and ammoniacal nitrogen. However, it is not known to what extent the differences in the growing conditions between the marijuana and the tobacco, including the types of fertilizers used, influenced the levels of nitrates in the plants. The temperature of combustion can also influence the production of ammonia. Burning tobacco results in a reduction of nitrate to ammonia, which is released to a greater extent during sidestream smoke formation (*31*), suggesting that lower combustion temperatures favor the production of ammonia. Combustion temperature differences between marijuana and tobacco may have also contributed to the differences in ammonia yield, but this was not verified.

Tobacco-specific nitrosamines were not found in the marijuana smoke (Tables 3 and 4). This result was expected, given that these compounds are derived from nicotine. Arsenic and lead were also noticeably absent from the marijuana smoke, which is consistent with the certificate of analysis provided with the plant material (data not shown). Again, this could be a function of the relatively controlled growth conditions.

NO and NO_x were significantly elevated in the marijuana smoke under both smoking regimes and in mainstream (Table 3) and sidestream smoke (Table 4). A logical explanation would be that these are arising from the nitrate present in the fertilizer and would be consistent with the very high ammonia yields.

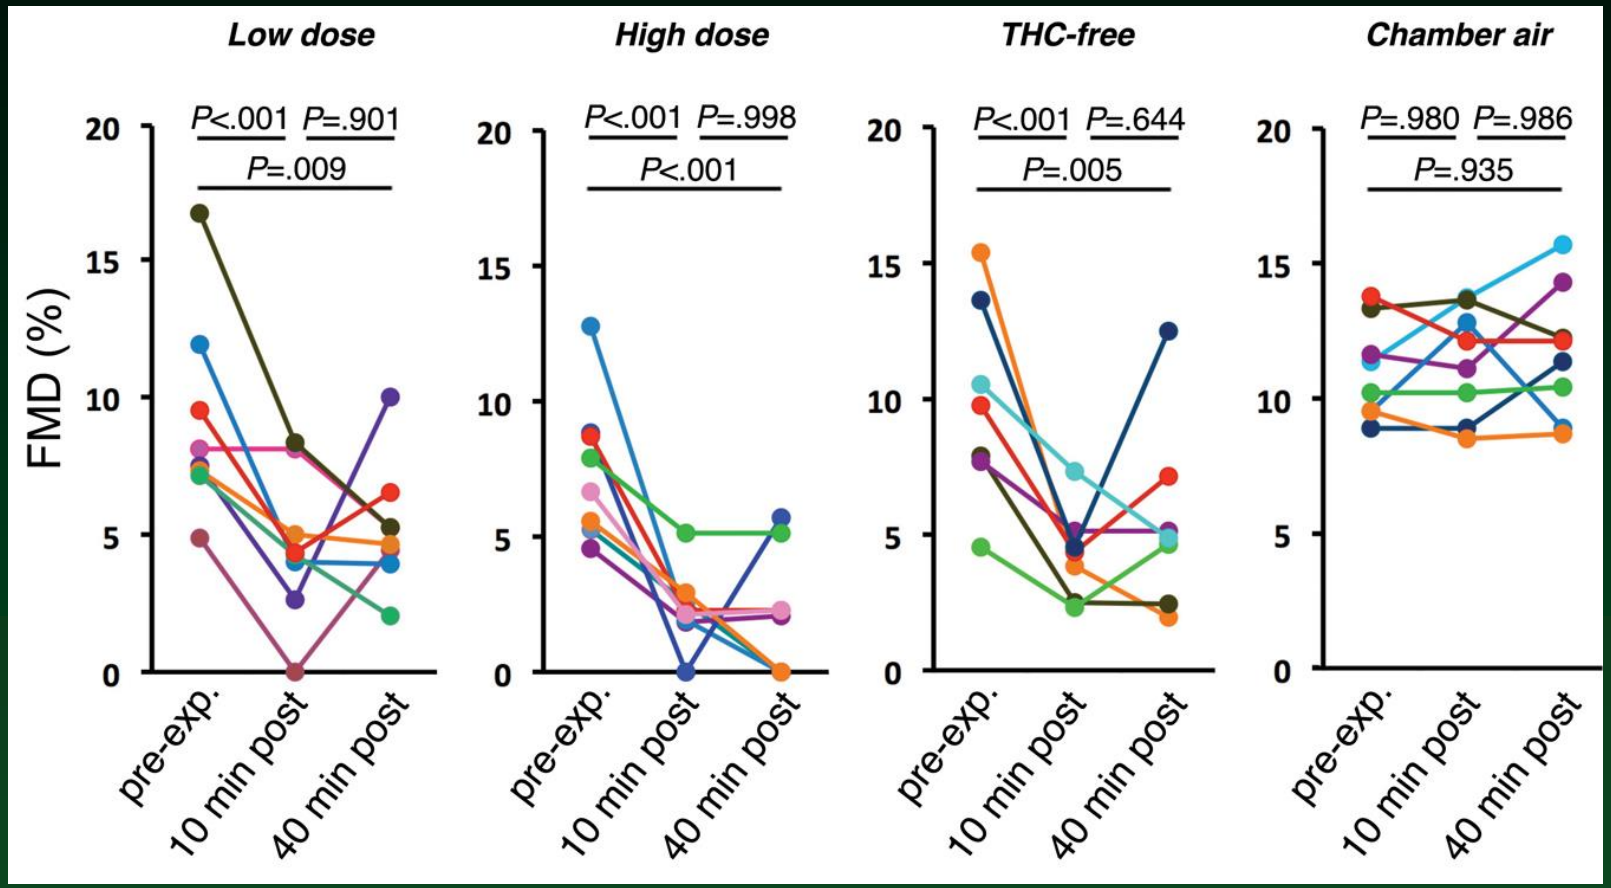
Marijuana SHS for 30 minutes impaired FMD (American Heart Association, Chicago, Nov. 2014)



Xiaoyin Wang

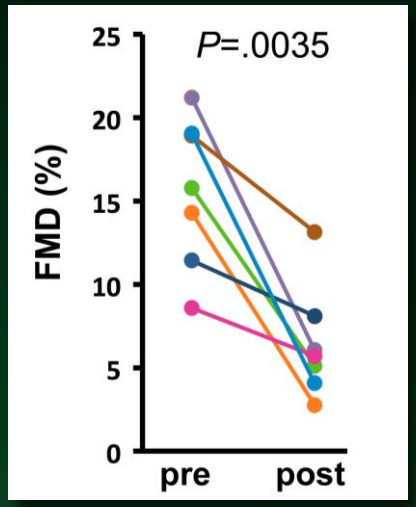
Ronak Derakhshandeh

Shilpa Narayan

low dose = ~200 µg/m^3 particles;
high dose = ~670 µg/m^3 particles
(starting concentrations)

“30 minutes is kind of long, how about shorter times?”

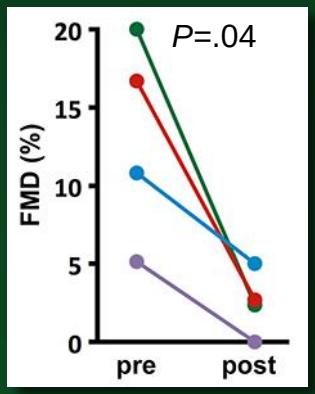
marijuana 1 min



59% drop in FMD

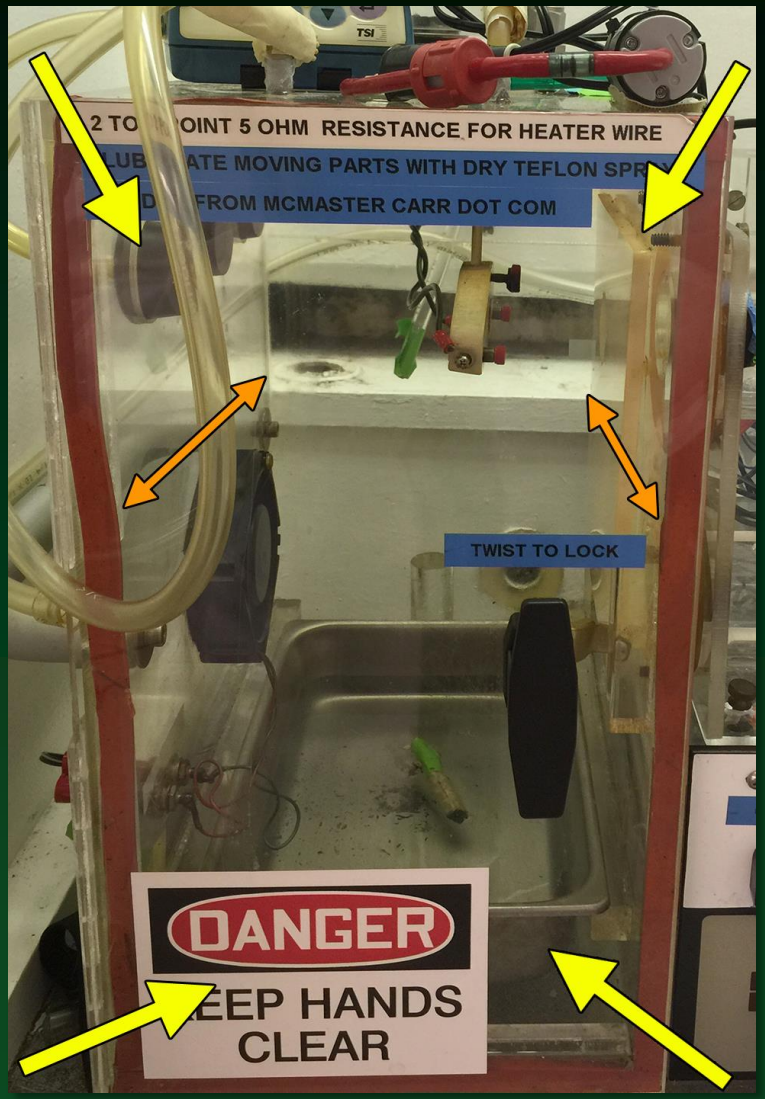
Marijuana SHS for 1 minute lowered FMD

“Could the impairment in FMD be caused by smoke from the burning paper, rather than tobacco and marijuana?”



SHS from marijuana without paper still impairs FMD

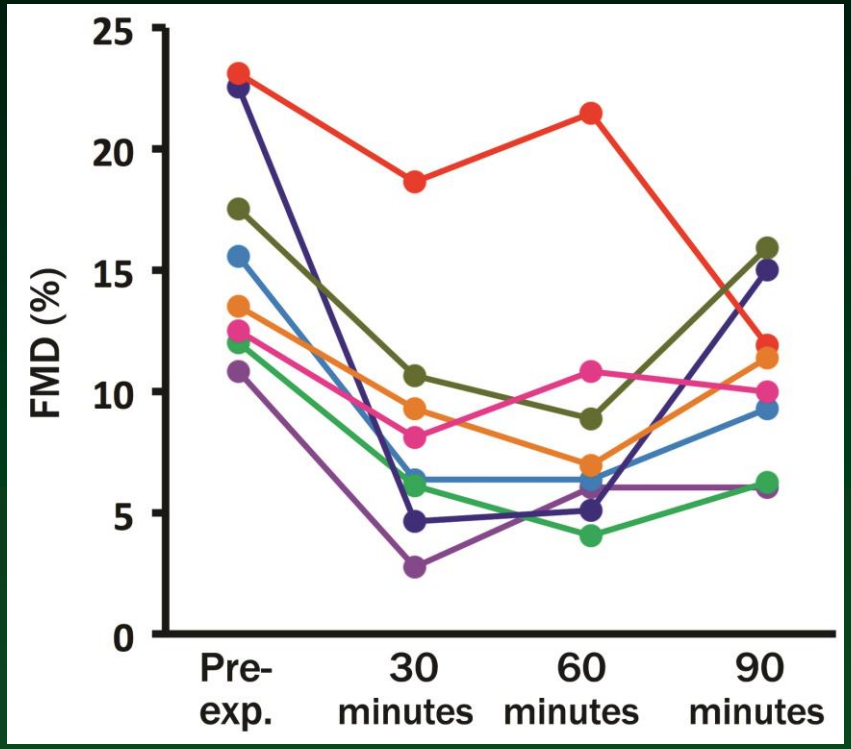
“They totally smoke out the rats”



The smoke was invisible in the exposure chamber

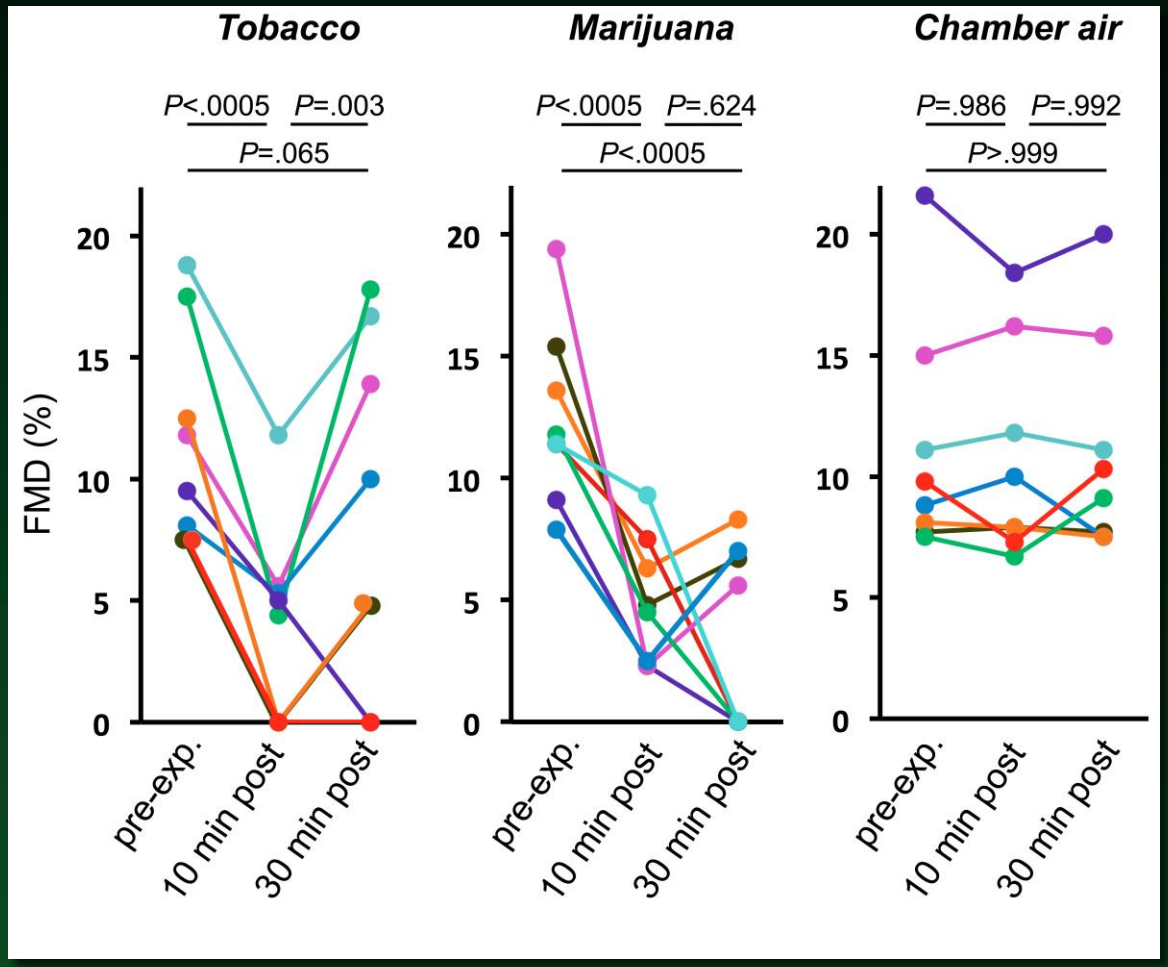
“How long does it take for FMD to recover?”

1 minute exposure (THC-free)



Marijuana SHS for 1 minute lowered FMD for at least 90 minutes

“How do marijuana and tobacco compare in impairment of FMD?”



Impairment from one minute of marijuana SHS persists longer than impairment from tobacco SHS

Summary of marijuana results

Wang et al., 2016, J Am Heart Assoc 5:e003858

Marijuana SHS for one minute substantially impairs vascular endothelial function in rats.

Neither THC nor paper smoke are required for marijuana SHS to impair vascular function.

...nicotine is not required for impairment of vascular function by smoke.

One minute of marijuana SHS exposure impairs vascular function for at least 90 minutes, longer than impairment from tobacco SHS.

City Council tweaks proposal for smoking restrictions at apartments

Medical marijuana smoking, with doctor's note, would be allowed only in designated area at complexes

by Jeremy Walsh / Pleasanton Weekly

The Pleasanton City Council took another step Tuesday toward establishing new stringent

Regulators and lawmakers

The Pleasanton City Council took another step Tuesday toward establishing new stringent smoking regulations for rental apartment complexes across the city.

Reviewing a proposed ordinance they gave initial support to two months ago, council members left most of the original proposal intact -- including the ban on tobacco smoking in apartment units and common areas -- but they adjusted course to limit medical marijuana smoking at complexes only to designated outdoor smoking areas.

Vice Mayor Jerry Pentin said he supported that option for medical marijuana smoking "so we're not banning it entirely but we're still keeping it away from people who are inside their own rental units and dealing with secondhand smoke."

Regulators and lawmakers

City staff's recommendation was to allow medical marijuana smoking inside apartment units "if tenant provides landlord written documentation that tenant needs it for medical purposes, no alternative means of delivery or ingestion are available and tenant is unable to smoke outside," assistant city attorney Larissa Seto said.

The council's follow-up discussion Tuesday focused on how to reduce the effects of secondhand smoke on neighbors living in close quarters in apartments while accommodating residents who rely on marijuana for legitimate medical reasons but can only smoke it -- and what about residents physically unable to leave their apartments…

Tamiko Johnson of the Alameda County Public Health Department also voiced support for prohibiting medical marijuana smoking indoors.

Regulators and lawmakers

"There's no safe level of secondhand smoke exposure," Johnson told the council. "From experience with other cities, gaining compliance with your smoke-free-housing law and having effective enforcement if you're allowing someone to smoke anything inside their apartment is going to be incredibly difficult for you all."

"I don't have problems with people smoking medical marijuana. I have problems with people who smoke it and then the person next door has to suffer from the secondhand smoke," Pentin said.

"When people take medication, it normally doesn't affect anybody else. And in this case, it does affect other people," Mayor Jerry Thorne added. "I just kind of wonder where you draw the line here. It's kind of darned if you do, darned if you don't."

How Dangerous Is Secondhand Marijuana Smoke?

DECEMBER 2, 2014 BY AARON WYSOCKI — LEAVE A COMMENT

Share 198 Tweet 0 Print More

Smoking marijuana is typically thought of as not that bad, especially compared to the hazards of drinking. But is secondhand smoke from marijuana more dangerous than people think? Or does it damage your lungs, heart, and blood vessels in the same ways as cigarette smoke? Find out with John and Sandra!

What do you think of this study? Will it deter you from smoking marijuana, or spending time around those who do? Let us know in the comments!

"The Young Turks Network"

Acute and long-term cardiovascular risk is unclear

Risk of MI goes up ~5-fold in the hour after marijuana use (Mittleman, 2001)

No clear correlation between long-term marijuana use and cardiovascular disease later in life (e.g., CARDIA study)

…but, 3-fold increase in risk of death from hypertension reported for marijuana users relative to non-users (Yankey, 2017)

EXPERT Q&A

Do Researchers Have the Right Marijuana?

by JEANINE BARONE | OCTOBER 25, 2016

Matt Springer, PhD, is a Professor of Medicine at the University of California, San Francisco, who studies the effects of secondhand marijuana smoke. He spoke with us about the implications of the recent announcement by the federal Drug Enforcement Administration that it will lift restrictions on the growing of marijuana to supply researchers.

How will the DEA's announcement affect your research?

Not as much as you might think. I still will not be able to study what I'd like to. I'd like to study real-world cannabis used by real people. UCSF used real-world cigarettes, not research-reference cigarettes, for tobacco studies in the past. But
